“I love Font Agent Pro because it works and I don’t have to deal with it unless I want to launch the app and browse my fonts.”

OpenType fonts

OpenType fonts use a single font file for both Windows® and Macintosh® computers, so you can move files from one platform to another without worrying about font substitution and other problems that cause text to reflow. They may include a number of features, such as swashes and discretionary ligatures, that aren't available in current PostScript and TrueType fonts.

Multiple master fonts

Multiple master fonts are customized Type 1 fonts whose typeface characteristics are described in terms of variable design axes, such as weight, width, style, and optical size.

Some multiple master fonts include an optical size axis, which lets you use a font specifically designed for optimal readability at a particular size.
